

Hands-free smart home control? Now you're talking.

An iZone Smart Home system is compatible with Google Home, Amazon Alexa and Apple's Siri allowing voice activation technology to be used to control everything 'smart' in a home. Airconditioning, lights, irrigation, roller blinds, entertainment – you name it!

Connectivity

iZone can easily work with other connected technologies and devices in the home, such as smart appliances and speakers, making it much simpler and faster to accomplish tasks. Asking Siri for a weather update or for the TV to be turned on, can all be done using voice control. Need multiple tasks done at the same time? No worries. Simply link a number of actions to a scene so that a one-phrase command triggers a series of events. "Hey Google, movie time!" – the lights dim, the TV turns on and the roller blinds come down. How easy is that?

Accessibility

Voice activation allows a greater number of people to access digital technology, connected devices, and the internet more easily. It improves accessibility for people with disabilities, especially for individuals who have impaired vision or motor function. Turning on smart lights and unlocking the front door without the need for hands is made possible with an iZone Smart Home system.

Convenience

Using voice activation can be significantly more convenient than typing something out on a keyboard or smartphone, or manually completing a task when your hands are occupied. It is also a lot faster to use voice command than scroll through menus on a mobile app – useful for moments when time is of the essence. Controlling your home while being completely hands-free is not just possible, it also saves time!

Personalisation

Voice activation technology creates a more personalised digital experience. Remembering information from previous interactions, offering helpful reminders, and distinguishing between multiple users from voice alone is all possible. The more voice activation is used, the easier it becomes.

Security

There's no hiding from the fact that any piece of technology comes with some risks. Voice-activated technology is no different. Privacy, identity fraud, data theft, malware and viruses are all issues facing the world today, however, whilst smart speakers continue to be the fastest growing consumer technology since the smart phone, there's no doubt security improvements are evolving and improving every day.

Total control of your smart home using your voice.

Secure for total piece of mind.
